

GOING ONE STEP FURTHER

FOR PATIENTS AND NURSES

*Eliminating Manual Vitals Documentation
to Prioritize Value-Added Care*

A large, specialty care and teaching hospital measured vitals capture and documentation times before and after connecting Connex® Vital Signs Monitors to its EMR. The hospital wanted to answer two questions:

1

HOW CAN WE SAVE NURSES TIME?

CNAs and RNs **saved 59 seconds** per vitals session by eliminating manual documentation.

That's a **34%** time savings.

Extrapolating these results over 12 months, that's:

6 minutes
per caregiver,
per round

36
caregiver hours
per day

13,208
caregiver
hours per year

2

WILL IT DRIVE MORE VALUE-ADDED CARE?

2.5% more time
on value-added
care activities

That's **18 minutes**
more per nurse,
per shift spent on
direct patient care.
